ChatGPT enters the Apple App Store policy battleground

Article

The news: Apple blocked the email app BlueMail developed by Blix due to new ChatGPT features.

• The app uses OpenAl's chatbot to help make automated email writing sound more natural based on users' previous emails and calendar events, per <u>The Wall Street Journal</u>.

- Apple is concerned that the **bot-based app could generate inappropriate content for children and wants a 17 years-and-older age restriction or content filtration added**. As of last week, the app had a 4 years-and-older minimum age restriction.
- Microsoft's updated version of <u>Bing AI for mobile</u> comes with a 17-years-old minimum age restriction on the App Store.

Rocky road ahead: The <u>App Store has long been a battleground</u> pitting Apple's policies against tech companies' desire for consumer reach. The latest disagreement over BlueMail's <u>ChatGPT</u> integration is a sign that tensions may worsen with the advent of commercial generative AI.

- Apple's wariness of the tech is likely heightened by the suggestion that tech companies could be held liable for AI-generated content during the Supreme Court's Section 230 deliberations just as the <u>FTC threatens its own intervention</u>.
- Microsoft has been <u>tweaking features and policies for Bing Al</u> following reports of the bot's disturbing responses.
- The wide gap between what's appropriate content for 4-year-olds and 17-year-olds means there's room for nuance in content filtration safeguards.

There's a solution and a catch: With the technology still in its experimental phase, we'll likely continue to see volatility in its commercial deployment.

- Microsoft's latest feature that allows users to switch between chatbot response styles could be further adapted for youth age categories to make the tech safer for minors.
- As generative Al models become more advanced, their capacity for spontaneous learning means that they may continue to go off-script despite safety features.
- What's more, a study found that for \$60, a bad actor could potentially make tiny changes to datasets used to train AI models.
- Such tampering could go undetected and yet have serious consequences for generative AI
 output and increase companies' liability risks.
